# Patrol Tag Inc., DBA Korner Safe

**ADDENDUM TO TEST REPORT 96727-19** 

Hub Model: Hub 1

**Tested To The Following Standards:** 

FCC Part 15 Subpart C Section(s) 15.207 & 15.247

Report No.: 96727-19A

Date of issue: May 6, 2015

This test report bears the accreditation symbol indicating that the testing performed herein meets the test and reporting requirements of ISO/IEC 17025 under the applicable scope of EMC testing for CKC Laboratories, Inc.

We strive to create long-term, trust based relationships by providing sound, adaptive, customer first testing services. We embrace each of our customers' unique EMC challenges, not as an interruption to set processes, but rather as the reason we are in business.

## **ADMINISTRATIVE INFORMATION**

## **Test Report Information**

REPORT PREPARED FOR: REPORT PREPARED BY:

Patrol Tag Inc., DBA Korner Safe Terri Rayle

1080 W. Ewing Place, Suite 300 CKC Laboratories, Inc.
Seattle, WA 98119 5046 Sierra Pines Drive
Mariposa, CA 95338

Representative: Chris Doughty Project Number: 96727

**DATE OF EQUIPMENT RECEIPT:** February 12, 2015 **DATE(S) OF TESTING:** February 12 - 13, 2015

## **Revision History**

**Original:** Testing of Hub, Model: Hub 1 to FCC Part 15 Subpart C Section 15.207 and 15.247. **Addendum A:** To replace the Radiated Spurious Band Edge plots.

## **Report Authorization**

The test data contained in this report documents the observed testing parameters pertaining to and are relevant for only the sample equipment tested in the agreed upon operational mode(s) and configuration(s) as identified herein. Compliance assessment remains the client's responsibility. This report may not be used to claim product endorsement by A2LA or any government agencies. This test report has been authorized for release under quality control from CKC Laboratories, Inc.

Steve Behm

Director of Quality Assurance & Engineering Services CKC Laboratories, Inc.

Page 3 of 47 Report No.: 96727-19A

## **Test Facility Information**

Our laboratories are configured to effectively test a wide variety of product types. CKC utilizes first class test equipment, anechoic chambers, data acquisition and information services to create accurate, repeatable and affordable test results.

TEST LOCATION(S): CKC Laboratories, Inc. 22116 23rd Drive S.E., Suite A Bothell, WA 98021-4413

## **Software Versions**

CKC Laboratories Proprietary Software	Version

## **SUMMARY OF RESULTS**

Standard / Specification: FCC Part 15 Subpart C

Test Procedure	Description	Modifications*	Results
15.207	Conducted Emissions	NA	Pass
15.247(a)(2)	Occupied Bandwidth	NA	Pass
15.247(b)(3)	Maximum Output Power	NA	Pass
15.247(d)	Conducted Spurious Emissions and Band Edge	NA	Pass
15.247(d)	Radiated Spurious Emissions and Band Edge	NA	Pass
15.247(e)	Power Spectral Density	NA	Pass

# **Modifications\* During Testing**

This list is a summary of the modifications made to the equipment during testing.

Summary of Conditions
No modifications were made during testing.

<sup>\*</sup>Modifications listed above must be incorporated into all production units.

## **Conditions During Testing**

This list is a summary of the conditions noted to the equipment during testing.

Summary of Conditions
None

Page 5 of 47 Report No.: 96727-19A

## **EQUIPMENT UNDER TEST (EUT)**

The following model has been tested by CKC Laboratories: Hub, Model: Hub 1

The manufacturer states that the following additional model is identical electrically to the one which was tested, or any differences between them does not affect their EMC characteristics, and therefore It meets the level of testing equivalent to the tested model: **Repeater 1** 

## **EQUIPMENT UNDER TEST**

### <u>Hub</u>

Manuf: Patrol Tag Inc., DBA Korner Safe

Model: Hub 1 Serial: None

#### **PERIPHERAL DEVICES**

The EUT was tested with the following peripheral device(s):

#### Laptop

Manuf: Lenovo Model: W530

Serial: None

### **Class 2 Power Unit**

Manuf: Phihong Model: PSM03A-050

Serial: None

## **Prosafe 5 Port Gigabit Switch**

Manuf: Netgear Model: GS105

Serial: 2N112435032BF

#### **Test Conditions / Notes:**

Temperature: 22°C Pressure: 102.0kPa Humidity: 45%

Frequency: 150k-30MHz Test Method: ANSI 63.4 (2009)

Mode: EUT is Transmit Mode

The EUT is located on top of a Styrofoam table, 80cm over the ground plane.

The EUT is investigated in laying and standing axis with only the worst case being reported.

The EUT is powered via the supplied power supply and its Ethernet is port run outside the chamber to an Ethernet switch at 100Mbps through unshielded Cat 5 which is then attached to the support laptop.

The buzzer is on.

## **Test Conditions / Setup**

Test Conditions: Temp: 22°C Humidity: 45% Pressure: 102.0kPa

Test Method: KDB 558074 D01 DTS Meas Guidance v03r02 & ANSI 63.10 (2009)

The EUT is powered via the supplied power supply and its Ethernet is port is connected to an Ethernet switch which is then attached to the support laptop.

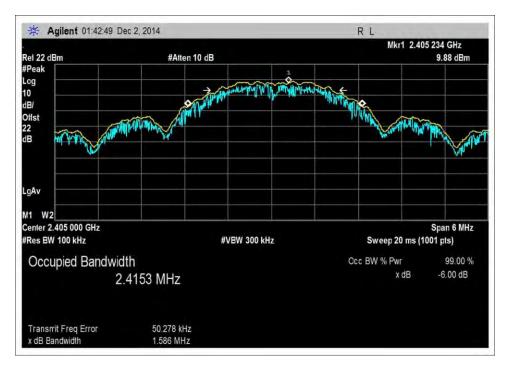

The EUT has a temporary antenna connector attached. The antenna connector is attached to the spectrum analyzer through attenuators and a cable. The correction factors of the attenuators and cable are corrected for in the spectrum analyzer.

Frequency (MHz)	6dB Bandwidth (MHz)
2405	1.586
2440	1.606
2480	1.602

Test Conditions: Temp: 22°C Humidity: 45% Pressure: 102.0kPa

Test Method: KDB 558074 D01 DTS Meas Guidance v03r02 & ANSI 63.10 (2009)

The EUT is powered via the supplied power supply (varied between 85% & 115% nominal voltage per 15.31(e) and its Ethernet is port is connected to an Ethernet switch at 100Mbps through unshielded Cat 5 which is then attached to the support laptop.

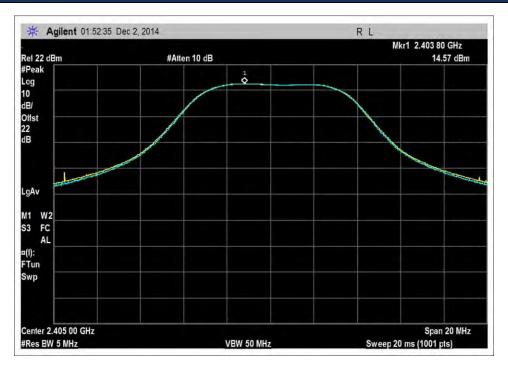

The EUT has a temporary antenna connector attached. The antenna connector is attached to the spectrum analyzer through attenuators and a cable. The correction factors of the attenuators and cable are corrected for in the spectrum analyzer.

Frequency (MHz)	Supply Voltage	Corrections due to cable & Attenuators (dB)	Corrected Reading	Conducted Power

### **Test Conditions / Notes:**

Temperature: 22°C Pressure: 102.0kPa Humidity: 45% Frequency: 9k-25GHz

Test Method: KDB 558074 D01 DTS Meas Guidance v03r02 & ANSI 63.10 (2009)

Mode: EUT is Transmitting at Low, Mid and High Channels

The EUT is located on top of a Styrofoam table, 80cm over the ground plane.

The EUT is investigated in Laying and standing axis with only the worst case being reported.

The EUT is powered via the supplied power supply and its Ethernet is port run outside the chamber to an Ethernet switch at 100Mbps through unshielded Cat 5 which is then attached to the support laptop.

The buzzer is on.

## **Test Conditions / Setup**

Test Conditions: Temp: 22°C Humidity: 45% Pressure: 102.0kPa

Test Method: KDB 558074 D01 DTS Meas Guidance v03r02

The EUT is powered via the supplied power supply and its Ethernet is port is connected to an Ethernet switch at 100Mbps through unshielded Cat 5 which is then attached to the support laptop.

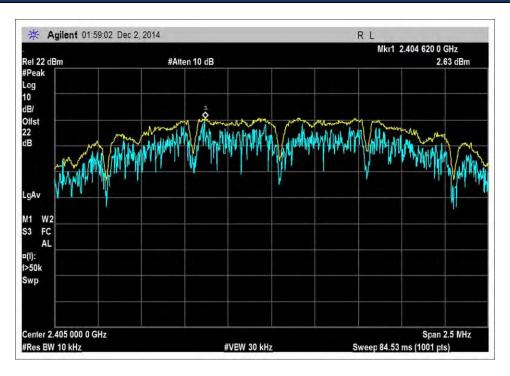

The EUT has a temporary antenna connector attached. The antenna connector is attached to the spectrum analyzer through attenuators and a cable. The correction factors of the attenuators and cable are corrected for in the spectrum analyzer.

Frequency (MHz)	Corrections due to cable & attenuators (dB)	Spectral Density (dBm)
2405	22.0	2.63
2440	22.0	2.62
2480	22.0	2.62

## **Measurement Uncertainty**

Uncertainty Value	Parameter
4.73 dB	Radiated Emissions
3.34 dB	Mains Conducted Emissions
3.30 dB	Disturbance Power

Reported uncertainties represent expanded uncertainties expressed at approximately the 95% confidence level using a coverage factor of k=2.

### **Emissions Test Details**

#### **TESTING PARAMETERS**

Unless otherwise indicated, the following configuration parameters are used for equipment setup: The cables were routed consistent with the typical application by varying the configuration of the test sample. Interface cables were connected to the available ports of the test unit. The effect of varying the position of the cables was investigated to find the configuration that produced maximum emissions. Cables were of the type and length specified in the individual requirements. The length of cable that produced maximum emissions was selected.

The equipment under test (EUT) was set up in a manner that represented its normal use, as shown in the setup photographs. Any special conditions required for the EUT to operate normally are identified in the comments that accompany the emissions tables.

The emissions data was taken with a spectrum analyzer or receiver. Incorporating the applicable correction factors for distance, antenna, cable loss and amplifier gain, the data was reduced as shown in the table below. The corrected data was then compared to the applicable emission limits. Preliminary and final measurements were taken in order to ensure that all emissions from the EUT were found and maximized.

#### **CORRECTION FACTORS**

The basic spectrum analyzer reading was converted using correction factors as shown in the highest emissions readings in the tables. For radiated emissions in  $dB\mu V/m$ , the spectrum analyzer reading in  $dB\mu V$  was corrected by using the following formula. This reading was then compared to the applicable specification limit.

Page 46 of 47 Report No.: 96727-19A

	SAMPLE CALCULATIONS								
	Meter reading	(dBμV)							
+	Antenna Factor	(dB)							
+	Cable Loss	(dB)							
-	Distance Correction	(dB)							
-	Preamplifier Gain	(dB)							
=	Corrected Reading	(dBμV/m)							

#### TEST INSTRUMENTATION AND ANALYZER SETTINGS

The test instrumentation and equipment listed were used to collect the emissions data. A spectrum analyzer or receiver was used for all measurements. Unless otherwise specified, the following table shows the measuring equipment bandwidth settings that were used in designated frequency bands. For testing emissions, an appropriate reference level and a vertical scale size of 10 dB per division were used.

MEASURING EQUIPMENT BANDWIDTH SETTINGS PER FREQUENCY RANGE			
TEST	BEGINNING FREQUENCY	ENDING FREQUENCY	BANDWIDTH SETTING
CONDUCTED EMISSIONS	150 kHz	30 MHz	9 kHz
RADIATED EMISSIONS	9 kHz	150 kHz	200 Hz
RADIATED EMISSIONS	150 kHz	30 MHz	9 kHz
RADIATED EMISSIONS	30 MHz	1000 MHz	120 kHz
RADIATED EMISSIONS	1000 MHz	>1 GHz	1 MHz

#### SPECTRUM ANALYZER/RECEIVER DETECTOR FUNCTIONS

The notes that accompany the measurements contained in the emissions tables indicate the type of detector function used to obtain the given readings. Unless otherwise noted, all readings were made in the "positive peak" detector mode. Whenever a "quasi-peak" or "average" reading was recorded, the measurement was annotated with a "QP" or an "Ave" on the appropriate rows of the data sheets. In cases where quasi-peak or average limits were employed and data exists for multiple measurement types for the same frequency then the peak measurement was retained in the report for reference, however the numbering for the affected row was removed and an arrow or carrot ("A") was placed in the far left-hand column indicating that the row above takes precedence for comparison to the limit. The following paragraphs describe in more detail the detector functions and when they were used to obtain the emissions data.

#### Peak

In this mode, the spectrum analyzer or receiver recorded all emissions at their peak value as the frequency band selected was scanned. By combining this function with another feature called "peak hold," the measurement device had the ability to measure intermittent or low duty cycle transient emission peak levels. In this mode the measuring device made a slow scan across the frequency band selected and measured the peak emission value found at each frequency across the band.

#### **Quasi-Peak**

Quasi-peak measurements were taken using the quasi-peak detector when the true peak values exceeded or were within 2 dB of a quasi-peak specification limit. Additional QP measurements may have been taken at the discretion of the operator.

#### **Average**

Average measurements were taken using the average detector when the true peak values exceeded or were within 2 dB of an average specification limit. Additional average measurements may have been taken at the discretion of the operator. If the specification or test procedure requires trace averaging, then the averaging was performed using 100 samples or as required by the specification. All other average measurements are performed using video bandwidth averaging. To make these measurements, the test engineer reduces the video bandwidth on the measuring device until the modulation of the signal is filtered out. At this point the measuring device is set into the linear mode and the scan time is reduced.
